Handbook of Research on Waldorf Education Dec 22 2019 Waldorf Education: An all-round, balanced approach to education that is equally concerned with intellectual-cognitive and artistic-creative learning. A practice- and experience-based pedagogy. Non-selective and open to all children and young people; offering a stress-free, secure learning environment across 12 grades; embedded in a community of students, teachers, and parents. An alternative education that has been successfully practiced for over a century. The first Waldorf School was founded in Stuttgart, Germany, in 1919. Today, Waldorf Education is practiced in all countries and cultures around the world: in over 1,000 schools, more than 2,000 kindergartens, and numerous centers for special needs education. This makes Waldorf Education the most prevalent alternative approach to teaching. And yet, despite the success and (now empirically validated) recognition that Waldorf schools enjoy, the theory underlying them remains controversial. Within the academic debate, Waldorf Education is seen as ideologic and unscientific. This publication sets out to bring clarity to this debate: Renowned researchers explain and discuss Waldorf Education's foundations in relation to the current discourse on education and core disciplines such as theory of knowledge, anthropology, developmental psychology, learning theory, and the theory of professions. This scientific inquiry into Waldorf Education is breaking new ground, casting light on its fascinating humanistic ideal and holistic potential.

Optimal Thinning within the Faustmann Approach Jan 23 2020 Forest stands are thinned all over the world. Yet, there was hitherto no consistent theory which allowed deriving unambiguous conditions for thinnings as the harvest of trees prior to the rotation age. Renke Coordes closes this gap by proposing a new, more general view on the Faustmann model as the basic investment model in forest resource economics. With the introduction of mutual interdependencies between the trees growing in a stand and the opportunity to harvest trees prior to the rotation age, optimal thinning regimes can be derived and analyzed. The implications of the proposed model are thoroughly discussed against the background of practical forest management decisions. The author closes with adaptations to the problems of the management of mixed, multiple-use and uneven-aged stands and entire forests. In this way, a unified perspective on the management of forests as natural resources is offered.
